

Bridges

Bridges that are fixed onto remaining teeth either side of the space can replace missing teeth. The supporting teeth are prepared and usually a temporary bridge is fitted, while a specialist technician makes the permanent bridge. The bridge is precision made with a precious metal base. Porcelain is then bonded onto the base to match the colour of your natural teeth.

Bridges need to be looked after with care to ensure that they last for many years. Our hygienists will spend time with you explaining, and showing you how to care for your bridge.
